## the Drupal way

Content Management System

### EEI is your Total Solution Provider *Optimize your Search Minimize your Risks*

- Facility Compliance Audits
- Country-Specific Audit Protocols
- Occupational Health Services
- Health, Fire Safety Training Programs
- HAZMAT Training Courses

“ Environmental and Energy Services for Industry (EEI) Corporation is into Safety, Industrial Hygiene and Security Services as well. ”

### About Project

To develop a Drupal website

### Business Challenge

Environmental and Energy Services for Industry (EEI) Corporation wanted a website which is easy to manage and has strong user role and access control functionality.

### JIVA's Solution

We developed the website with custom user roles with custom access levels as per the client's requirement. We also made sure that the custom built modules are scalable, keeping in view the future enhancements of the website.

### Benefits

We custom built a module to add an event to the site and a Google Calendar at the same time. The primary aim was to synchronize events between the site and a Google Calendar. We also custom built a video module which is password protected. With a protected video module the users can access a video only with a password they provided when the video was created. This restricts unauthorized viewing of clients' videos.

Since it is easier to add new features and even reshape website from a simple presentation site to a web application in the future, we suggested Drupal. We made sure that the website is meticulously crafted and maintained a well-designed code. To enhance the user experience and make the content easy to find and retrieve, we empowered end-users to create ever changing tagging structure by themselves, rather than the system administrator.

This enables users to create relationships between categories or vocabulary terms without a need for reprogramming the system.

### Highlights

- Protected video module
- Meticulously crafted and maintained a well-designed code
- Easy Scalability
- Search Engine Friendly
- PHP programming; as it has built-in features to handle heavily trafficked sites
